Student Data Left on the Table

Schools had abundant data, but educators couldn't harness it for **timely, actionable insights** to support **individual students**.

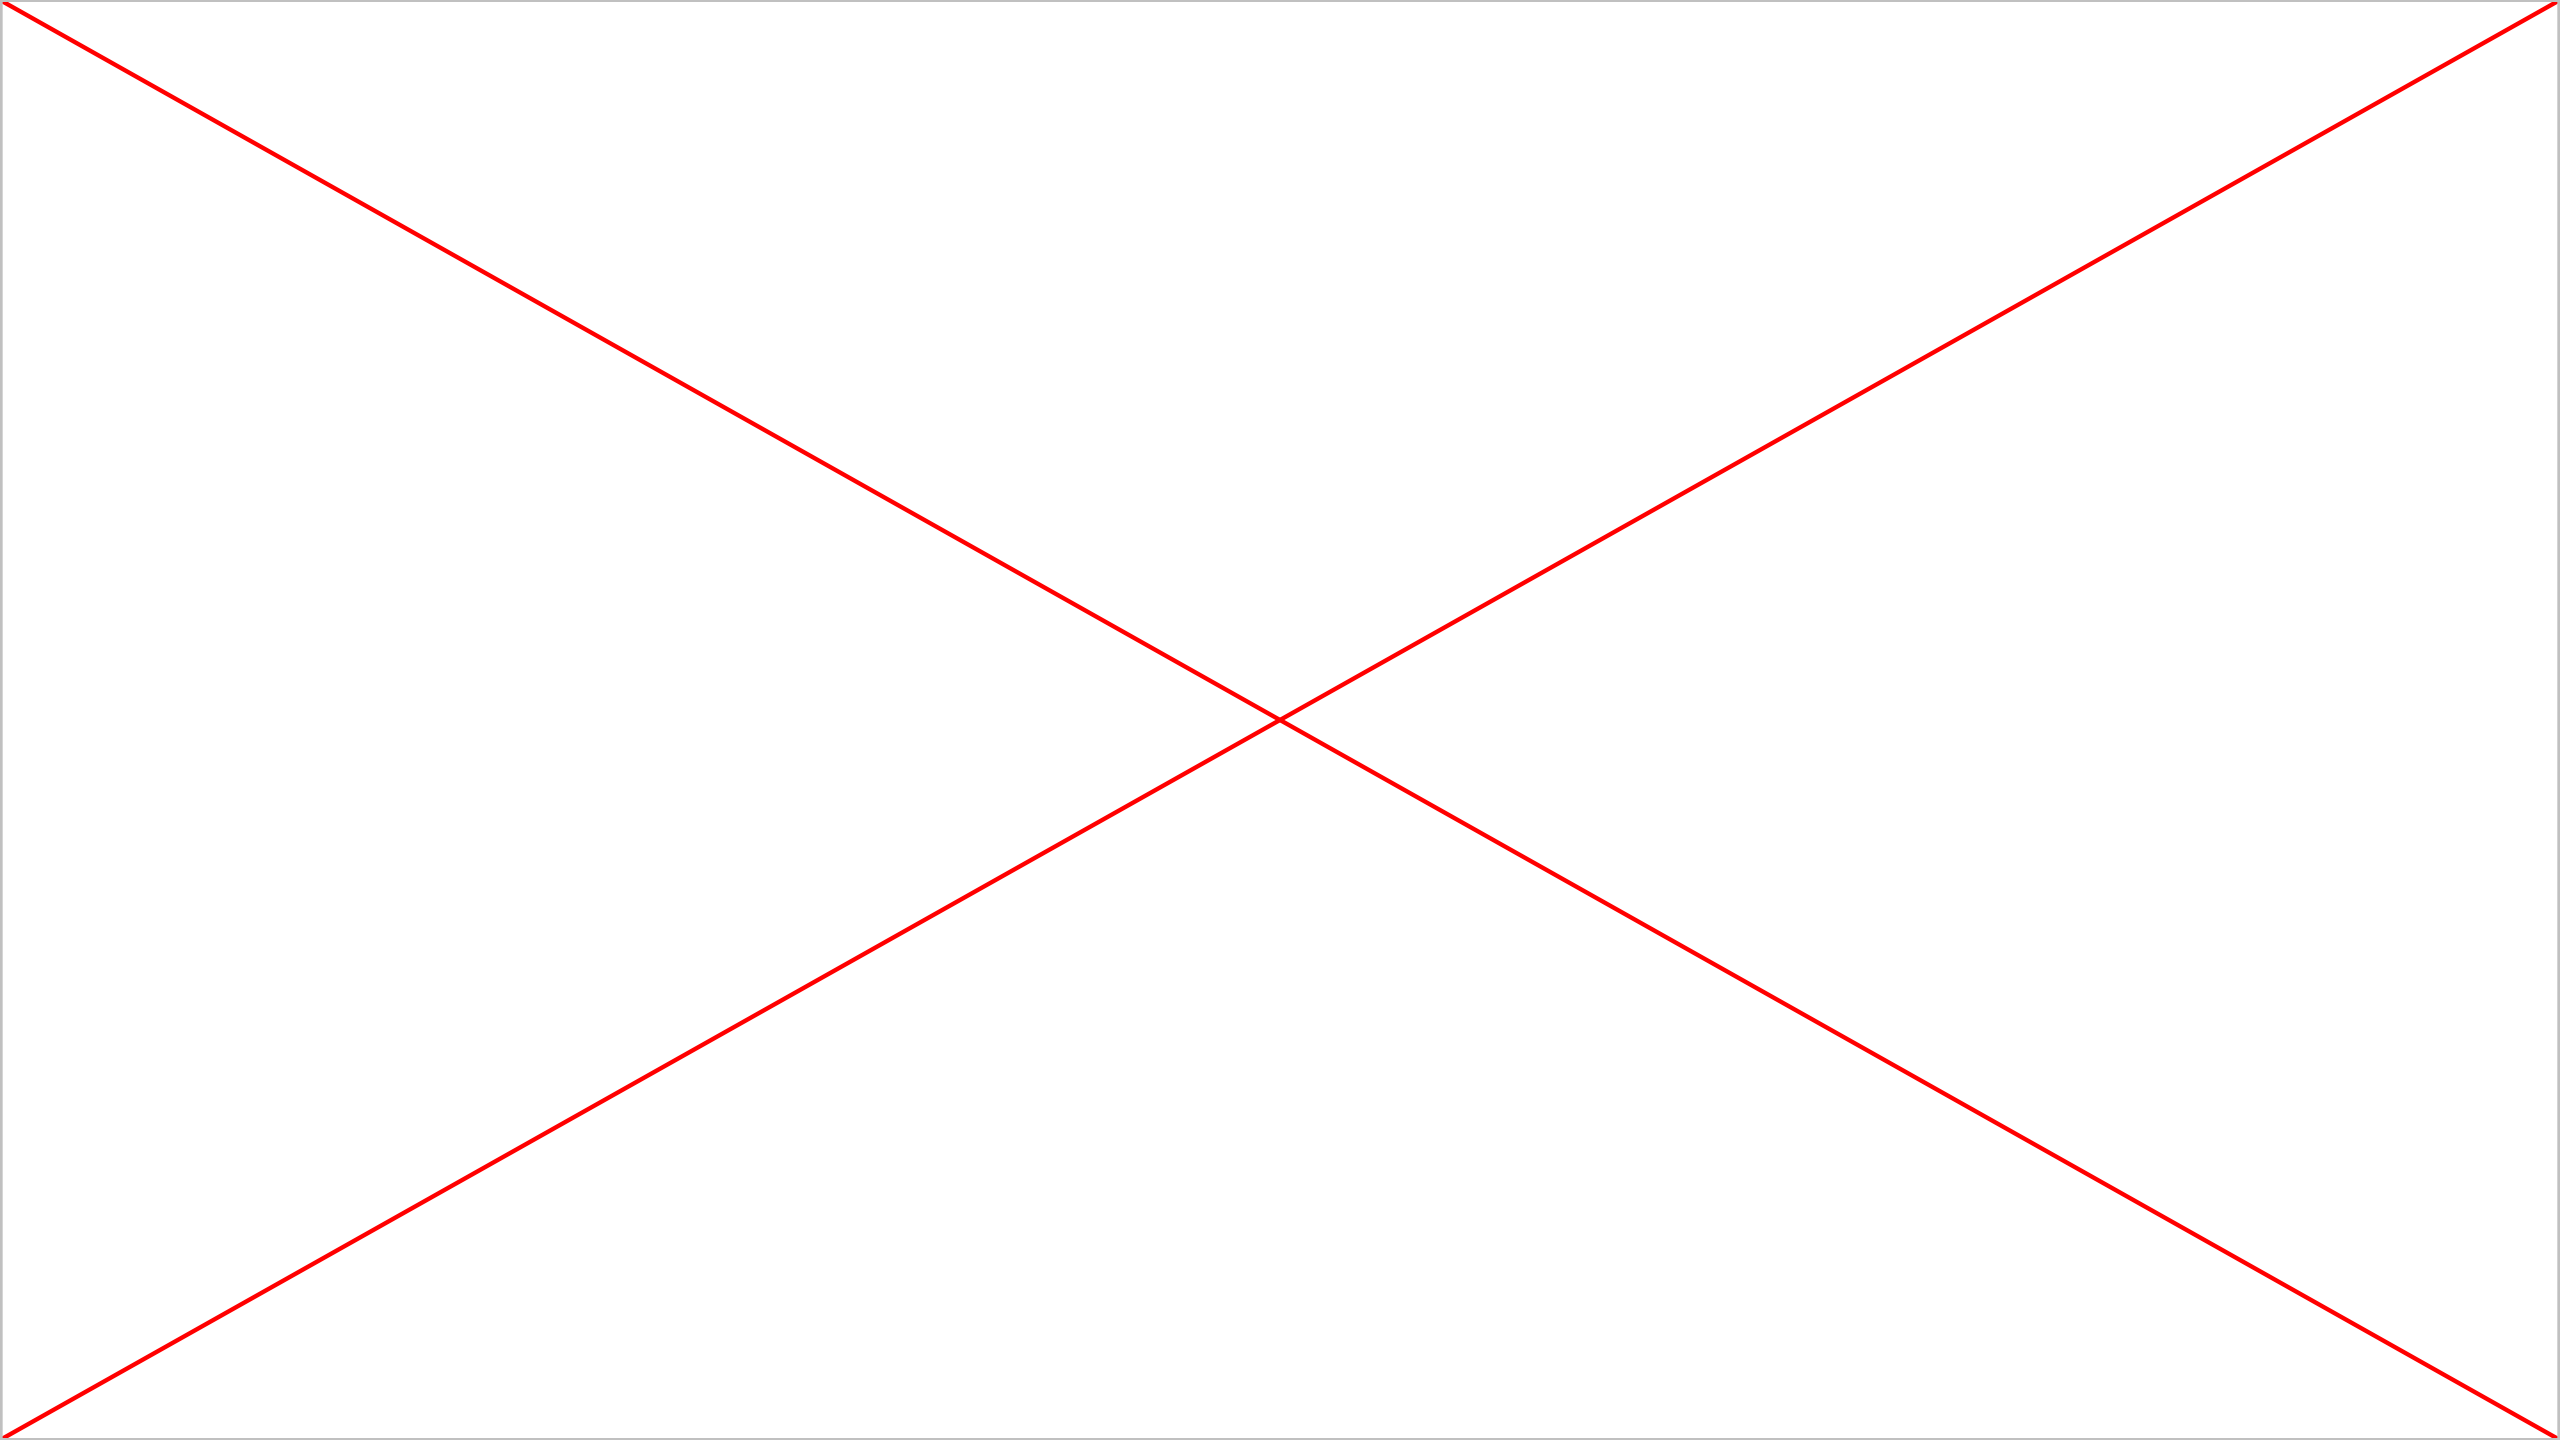

How We Generated **On-Demand Student Insights**

Educators ask questions in plain language → the system produces insights instantly

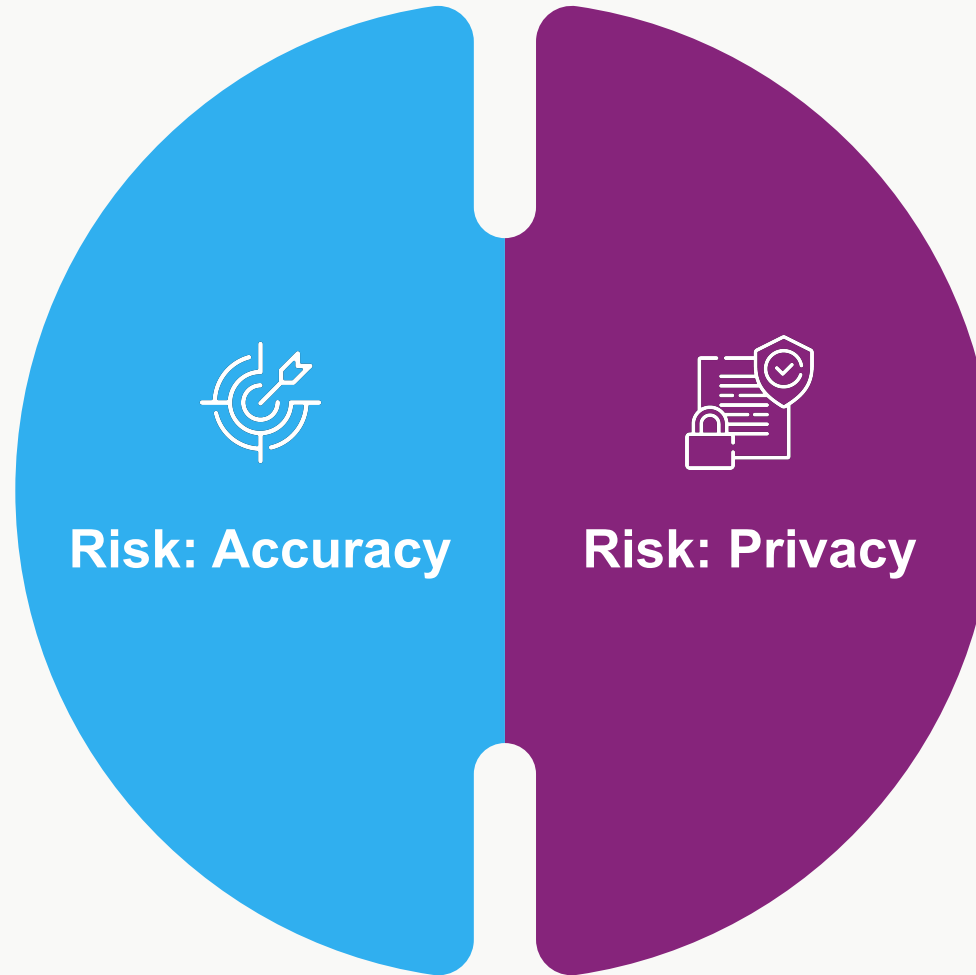

Example: “Which students are at risk of failing in my class?”

- 1 Students currently failing or flagged as high risk
- 2 Grade trend visualization showing performance trajectories
- 3 Explanation of key drivers (e.g. attendance drop, behavior signals)

Built-In Safeguards

- Model may generate incorrect SQL or misinterpret data
- **Mitigation:** Test set of educator questions, output comparison, human evaluation, iterative refinement

- Potential exposure of sensitive student information
- **Mitigation:** No PII exposure to model, students referenced by ID only

From Insights **to Action**

Early detection enables proactive support

Example Scenario

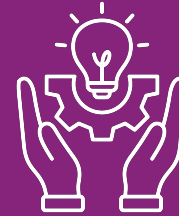

Detected signal: Performance drop after significant life event

Recommended action: Contact parents or schedule counselor session

Transformation

Manual reporting → real-time insight → proactive support

35%

Recommendation Adoption Rate
